

Ortronics Lumen pre-polished fiber connectors

Sunday, 21 February 2010

Legrand Ortronics says its new Lumen pre-polished fiber connectors bring an unprecedented level of ease and reliability to fiber field installations by reducing installation time to two minutes or less on a prepared optical fiber, without the need for special installation tools or equipment. The reusable pre-polished connectors feature a built-in window in the connector body that allows a visible fault locator (VFL) to be used to verify proper installation during assembly. The connector may also be reapplied up to five times simply by deactivating the fiber locking feature, re-cleaving the fiber and reinstalling the connector. Lumen LC connectors are available in 50 micron LOMF, single-mode, and 62.5 versions. SC and ST versions will be introduced later this year.
